

GLYCOGEN STORAGE DISEASES

- The **metabolic defects** concerned with the **glycogen synthesis** and **degradation** are collectively referred to as glycogen storage diseases.
- These disorders are characterized by deposition of normal or abnormal type of glycogen in one or more tissues.

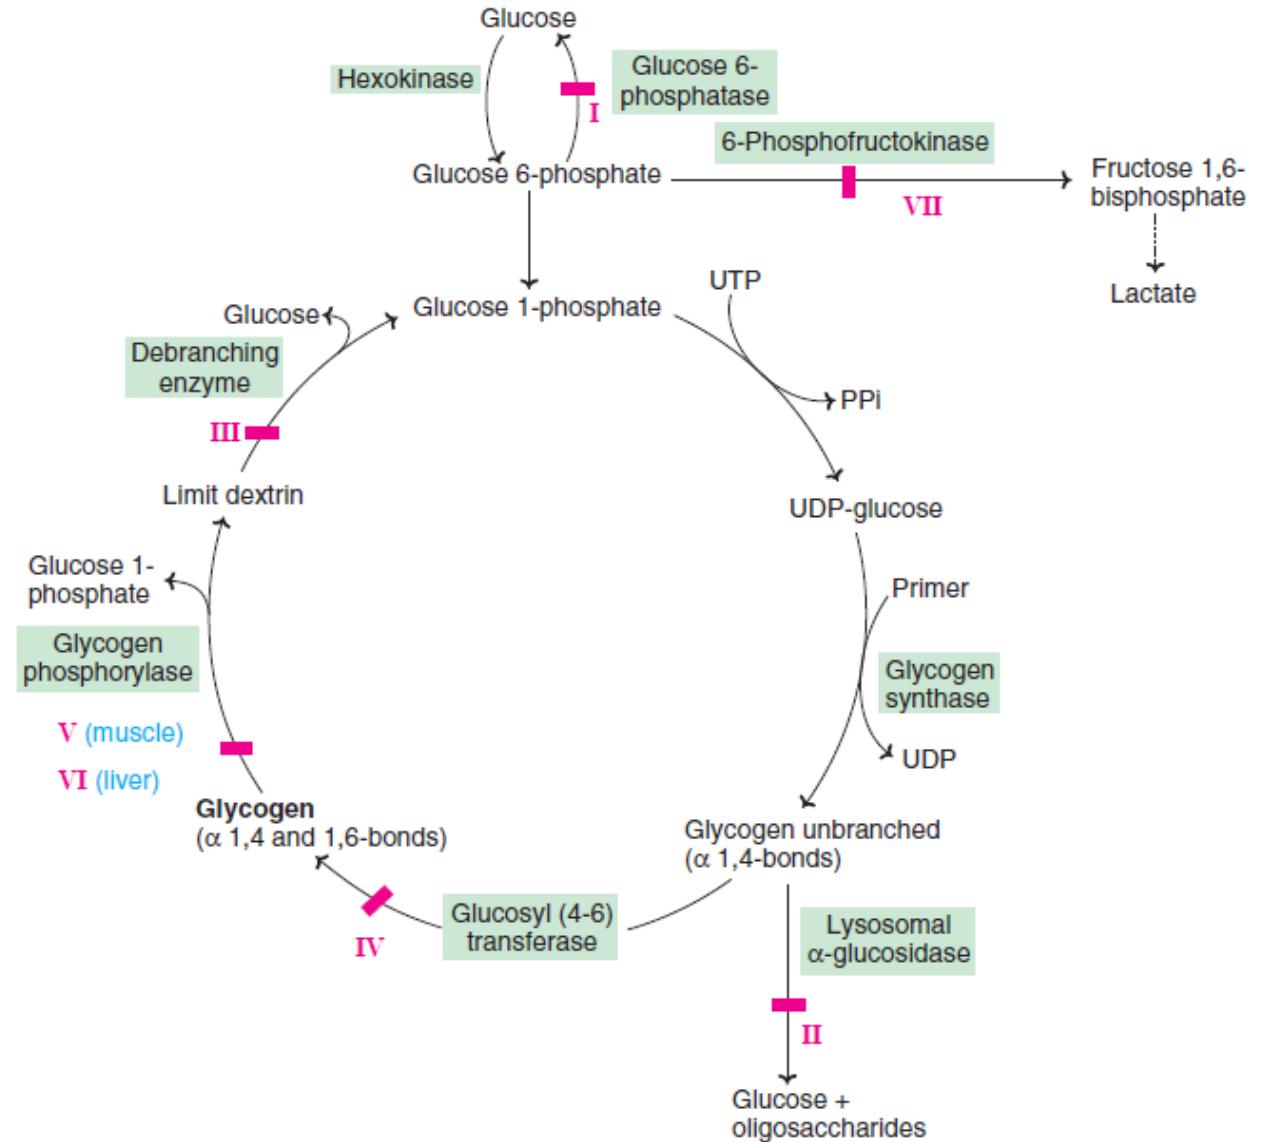

Fig. 13.19 : Summary of glycogen metabolism with glycogen storage diseases (Red blocks indicate storage disease, **I**–von Gierke's disease; **II**–Pompe's disease; **III**–Cori's disease; **IV**–Anderson's disease; **V**–Mc Ardle's disease; **VI**–Her's disease; **VII**–Tarui's disease).

TABLE 13.2 Glycogen storage diseases – biochemical lesions and characteristic features

<i>Type</i>	<i>Name</i>	<i>Enzyme defect</i>	<i>Organ(s) involved</i>	<i>Characteristic features</i>
I	von Gierke's disease (type I glycogenosis)	Glucose 6-phosphatase	Liver, kidney and intestine	Glycogen accumulates in hepatocytes and renal cells, enlarged liver and kidney, fasting hypoglycemia, lactic acidemia; hyperlipidemia; ketosis; gouty arthritis.
II	Pompe's disease	Lysosomal α -1,4 glucosidase (acid maltase)	All organs	Glycogen accumulates in lysosomes in almost all the tissues; heart is mostly involved; enlarged liver and heart, nervous system is also affected; death occurs at an early age due to heart failure.
III	Cori's disease (limit dextrinosis, Forbe's disease)	Amylo α -1,6-glucosidase (debranching enzyme)	Liver, muscle, heart, leucocytes	Branched chain glycogen accumulates; liver enlarged; clinical manifestations are similar but milder compared to von Gierke's disease.
IV	Anderson's disease (amylopectinosis)	Glucosyl 4-6 transferase (branching enzyme)	Most tissues	A rare disease, glycogen with only few branches accumulate; cirrhosis of liver, impairment in liver function.
V	McArdle's disease (type V glycogenosis)	Muscle glycogen phosphorylase	Skeletal muscle	Muscle glycogen stores very high, not available during exercise; subjects cannot perform strenuous exercise; suffer from muscle cramps; blood lactate and pyruvate do not increase after exercise; muscles may get damaged due to inadequate energy supply.
VI	Her's disease	Liver glycogen phosphorylase	Liver	Liver enlarged; liver glycogen cannot form glucose; mild hypoglycemia and ketosis seen.
VII	Tarui's disease	Phosphofructokinase	Skeletal muscle, erythrocytes	Muscle cramps due to exercise; blood lactate not elevated; hemolysis occurs.

Rare glycogen disorders VIII, IX, X and XI have been identified. They are due to defects in the enzymes concerned with activating and deactivating liver phosphorylase.
